WORK EXPERIENCE

Activities are centred on functional evaluation of children affected by chronic disease, the more frequently performed tests are: LFT, Exercise stress test, Holter monitoring, Ambulatory Blood Pressure Monitoring. These tests study the child during movement and, added to other tests such as echocardiography, give us data on the healthy status of the child and about the range of possibilities and abilities for participation in sport for children with chronic health condition. At the moment our interest is on children with congenital heart disease, arterial hypertension, in particular obese children with hepatic steatosis, children with asthma, cystic fibrosis.

September 1986 - 1989 **Hospital for Sick Children** Toronto Ontario CND.
